PROJECT 2

Project 2: Building Basic Calculator using Tkinter

By: Sanjeet Kumar

NextHikes IT Solutions

Made with GAMMA

Why build a GUI calculator?

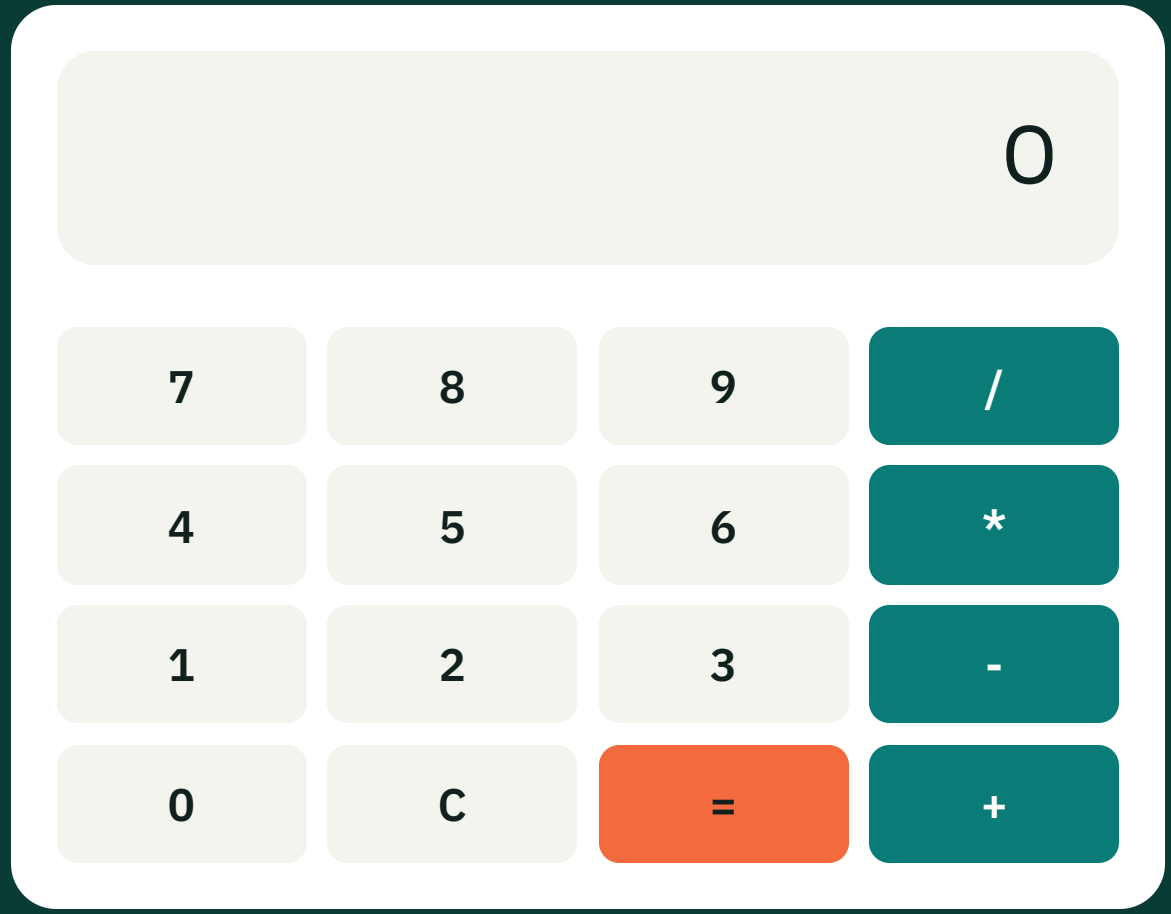

- Why GUI calculator?
- Tkinter → Python’s standard GUI toolkit
- Goal → User-friendly calculator with core operations

Made with GAMMA

The calculator combines a clear screen with familiar controls

1. Equation display area (screen)
2. Clickable buttons: 0–9, +, -, *, /, =, C
3. Core operations: Add, Subtract, Multiply, Divide
4. Clear & evaluate functionality

Made with GAMMA

Three functions power the interaction

1. **press()** → update expression
2. **equalpress()** → evaluate expression
3. **clear()** → reset screen
4. Tkinter widgets: **Entry**, **Button**
5. Grid layout for buttons

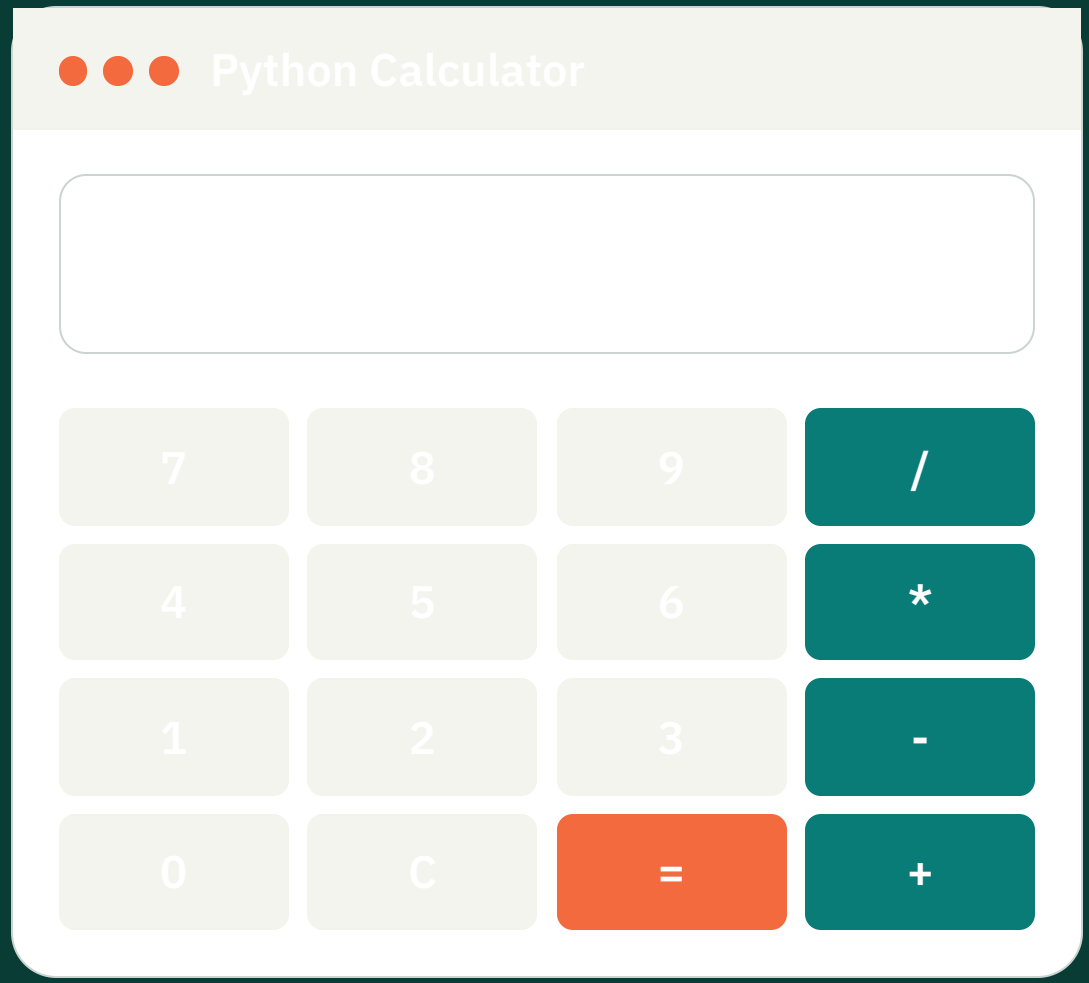

```
# calculator interaction
def press(key):
    expression = screen.get()
    screen.set(expression + key)
def equalpress():
    screen.set(result)
def clear():
    screen.set("")
```

Made with GAMMA

OUTPUT

Python Calculator GUI Window

Shows buttons arranged in grid and displays results on top entry field.

What the project helped me learn

Core Python concepts

Tkinter library usage

IDE (VS Code) workflow

GitHub integration

Application development basics

Made with GAMMA

Final submission brings code, explanation, and proof together

1. Python script in Project folder
2. Presentation with explanation + output
3. GitHub link with code

PROJECT FOLDER

Python script

PRESENTATION

Explanation + output

GITHUB LINK

PART TWO · ANALYTICS

Cricket Performance Dashboard

Tableau dashboard built from a cricket dataset.

Made with GAMMA

DASHBOARD FOUNDATION

Three KPIs anchor the cricket dashboard

Total Runs

Total Matches

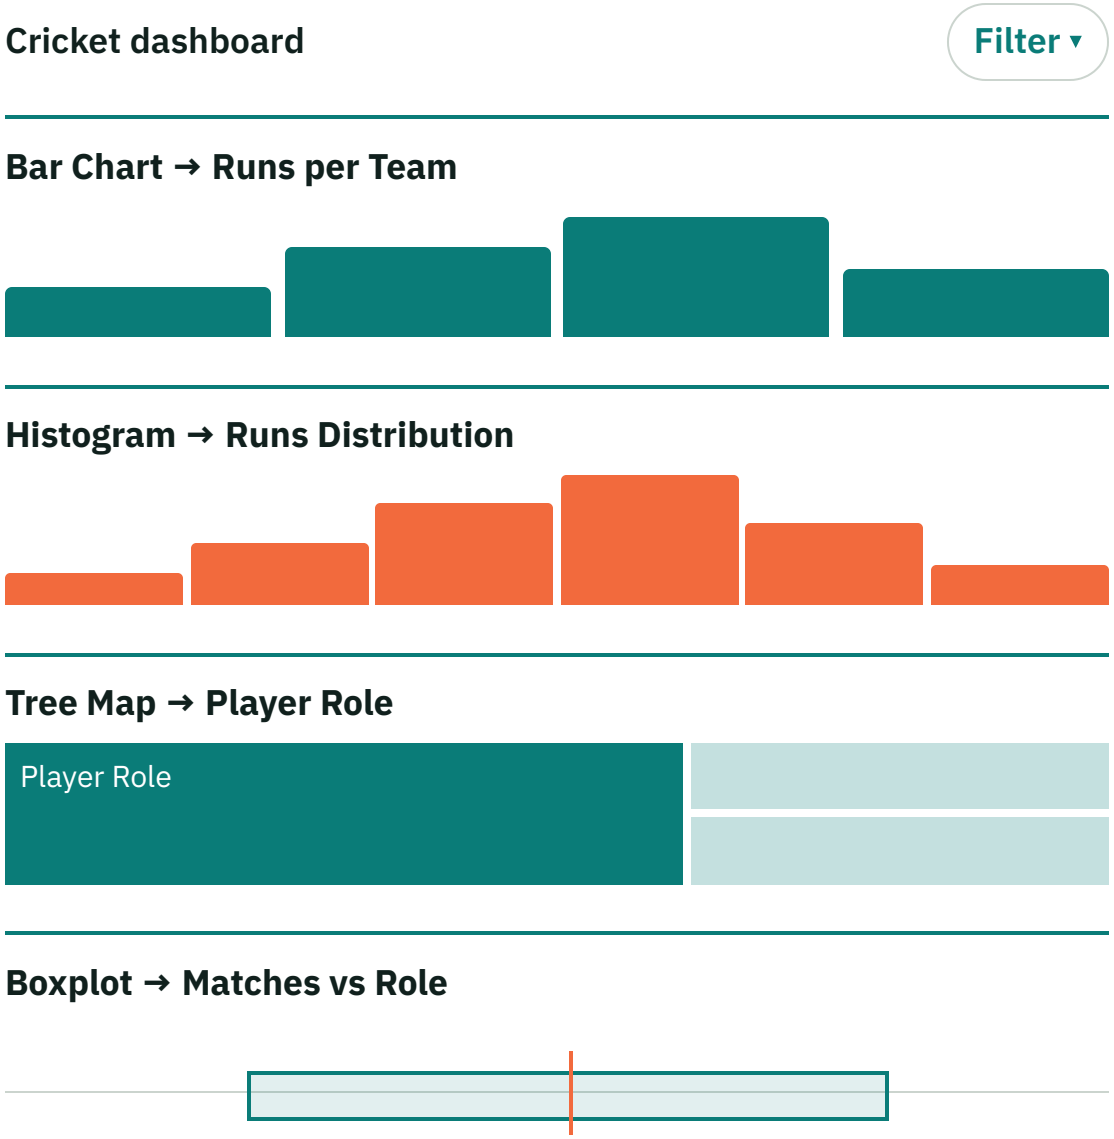

Total Wickets

Made with GAMMA

Four views reveal performance from different angles

1. Bar Chart → Runs per Team
2. Histogram → Runs Distribution
3. Tree Map → Player Role
4. Boxplot → Matches vs Role
